AI & Agent Engineering Assignment

Give our voice console something worth talking to.

We built a console that can already listen, think out loud, and show its work. What it doesn't have is a brain. That's your job.

Build an AI agent — or a small team of them — that does something genuinely useful, teach it to talk, and let it act. Pick a problem you find interesting. There's no single right answer, and we care far more about how you think than about how much code you write.

01 // THE IDEA

Most take-homes ask you to build a UI from scratch. We'd rather skip the boilerplate. So we're handing you a working voice console and letting you spend your time on the interesting half: the agents behind it. Make it yours.

02 // WHAT YOU'LL BUILD

- **An agent with a point of view.** Something that solves a real problem — on OpenClaw, using whatever model you like.
- **A voice.** The console already speaks. You give it something worth saying.
- **Real work, not just chat.** Let it use tools and skills so it actually gets things done.
- **A sense of caution.** Anything risky should stop and ask a human first.

03 // WHAT WE'RE HANDING YOU

A working console

Hold-to-talk, a hands-free mode, a live step-by-step view, and a 3D room. All built and ready.

A starting blueprint

Our full architecture is in the repo if you want a guide. Follow it, adapt it, or ignore it — your call.

An approval panel

Already wired. When your agent proposes something risky, the console asks you before it runs.

Room to play

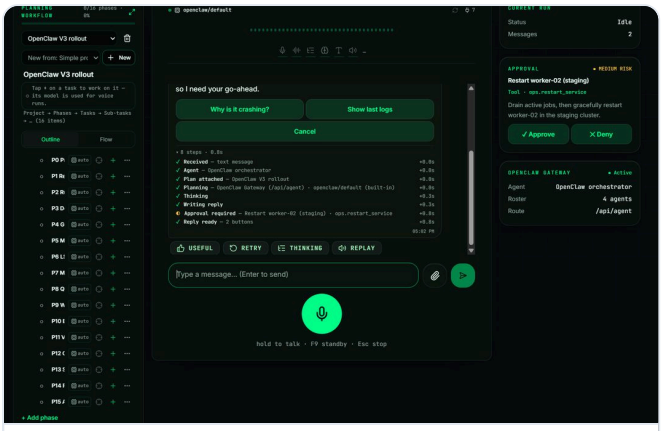

The frontend works out of the box, so nothing stands between you and the agent you want to build.

04 // WHAT WE'D LOVE TO SEE

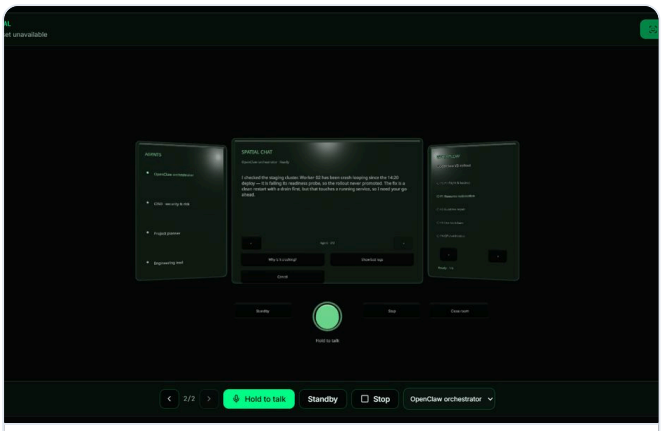

- **Talk to it.** Voice in, voice out — natural enough that you'd actually use it.
- **Watch it think.** Its steps, tools and reasoning show up live as it works.
- **It actually does things.** Real skills and tools, not a chatbot pretending.
- **It knows its limits.** Anything consequential waits for a human "yes".

05 // WHAT YOU'RE WORKING WITH

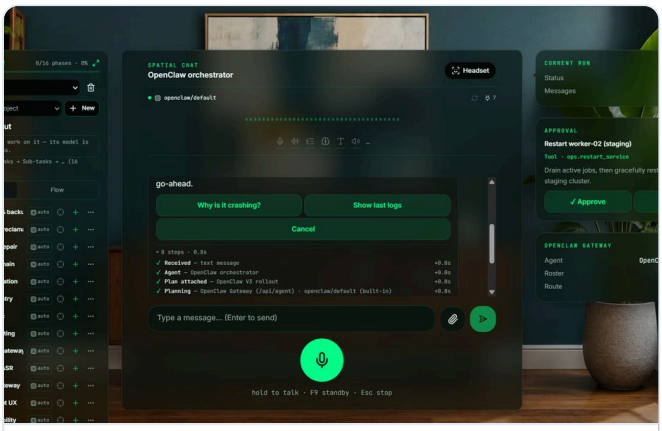

This is the console as it ships — voice, live steps, the approval gate, the blueprint, and a 3D room. Your agent plugs into the middle of all of it.

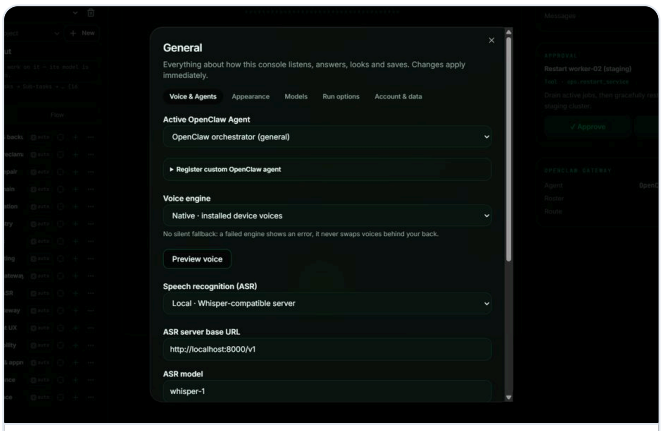

Talk console — voice in, live steps, approval

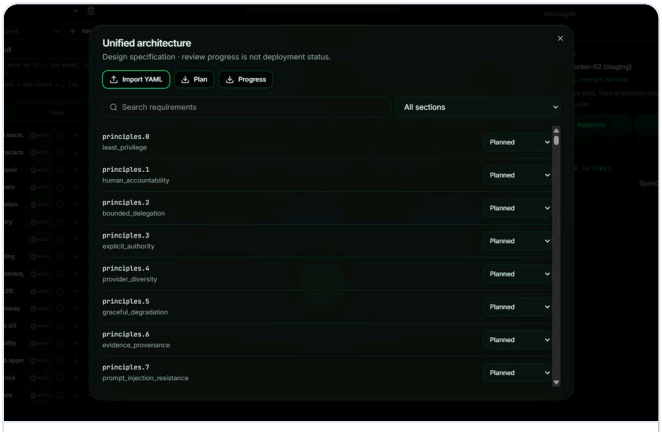

Headset room — a calm 3D space

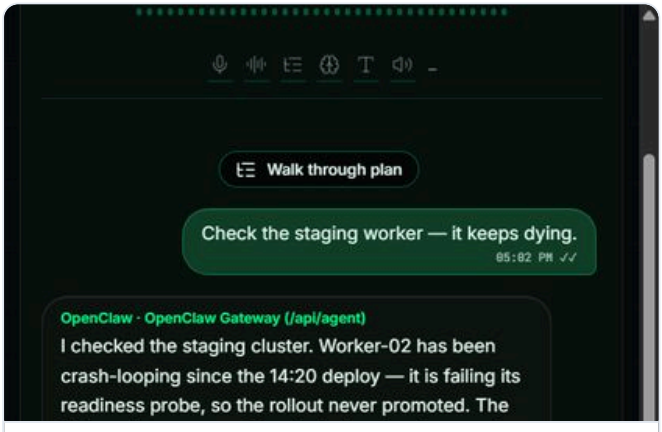

Spatial chat — the same chat, over any scene

General settings — register your own agents

The blueprint — 700+ requirements to review

On mobile — the same console, in your pocket

06 // WHERE TO PLUG IN

Three places matter, and you don't need more to start:

- **The bridge.** `src/routes/api/agent.ts` is where the console talks to your agent. Point it at your setup.
- **Your agents.** Add them to one list and they appear in the console and the 3D room automatically.
- **The approval panel.** It already catches risky action requests. You just have to teach your agent to ask.

Full details, the agent contract, and a sample approval request live in `ASSIGNMENT.md` inside the repo. Use it when you're ready, not before.

07 // TIME

A weekend is plenty. The core should take a focused half-day; polish and stretch goals can take longer. Don't over-engineer it — a small, sharp system beats a big, half-working one.

08 // GROUND RULES

- **Use AI tools.** We expect it. Just note in your README where they helped.
- **Rough is fine.** We're reading your judgment, not your polish.
- **No fake results.** If something fails, show the real error — never swap in fake data.

09 // HOW WE'LL READ IT

BASELINE	It works. We can talk to it, it answers, and it uses a tool or two.
STRONG	It handles the messy cases too, the code reads well, and you clearly thought before you typed.
EXCEPTIONAL	It feels like it could grow — it does things we didn't ask for, and we'd trust it to make its own decisions.

10 // WHAT TO SEND

- Your code — a repo or a zip.
- An `openclaw/` folder with your agents and skills, so we can run them.
- A short README: what you built, the calls you made, and where AI helped.

11 // WHAT HAPPENS NEXT

We'll sit down together and walk through what you built — your choices, your trade-offs, and a small extension, live. It's a conversation, not a test. You'll hear back from us either way.
